

WE CLAIM:

1. In a computer network with a plurality of network devices, a method for distributed generation of unique random numbers for digital cookies, comprising the steps of:

5 generating a first portion of a x-bit digital cookie on a first network device on the computer network based on an x-bit bit mask template sent to the first network device from a second network device on the computer network;

sending a first message to request a second portion of the x-bit digital cookie from the second network device, wherein the first message includes the first portion of the 10 x-bit digital cookie;

receiving a first response from the second network device wherein the first response includes a second portion of the x-bit digital cookie from the second network device, and wherein the second network device generates potential x-bit digital cookies using the first portion of the x-bit digital cookie from the first network device and a 15 second portion of the x-bit digital cookie generated on the second network device until the second network device generates a potential x-bit digital cookie that is not in use on the computer network;

generating a complete x-bit digital cookie on the first network device using the first portion of the x-bit digital cookie and the second portion of the x-bit digital cookie, 20 wherein the complete x-bit digital cookie is not in use on the computer network.

2. A computer readable medium having stored therein instructions for causing a central processing unit to execute the method of Claim 1.

3. The method of Claim 1 further comprising:

5 sending the complete x-bit digital cookie in a plurality of messages used to a establish a secure connection between the first network device on the computer network and third network device on a remote computer network.

4. The method of Claim 4 wherein the plurality of messages include a plurality of

10 Internet Key Exchange protocol messages.

5. The method of Claim 1 wherein the step of generating a first portion of an x-bit digital cookie includes generating a n-bit random number, wherein the number-n is determined by counting n-number of bits set to a value of one in the x-bit bit mask sent to 15 the first network device by the second network device.

6. The method of Claim 1 wherein the second portion of the bit mask is an (x-n) bit random number generated on the second network device, wherein n is less than or equal to x.

20

7. The method of Claim 1 wherein the x-bit bit mask template is a 64-bit, bit mask template.

8. The method of Claim 1 wherein the step of generating a complete x-bit digital cookie on the first network device includes generating a complete x-bit digital cookie on the first network device by placing values of bits from the first portion of the x-bit digital cookie in bit positions with a value of one using the x-bit bit mask template, and by
5 placing values of bits from the second portion of the x-bit digital cookie in bit positions with a value of zero using the x-bit bit mask template.

9. The method of Claim 1 wherein the second network device is any of a
Distributed Network Address Translation gateway or a Realm Specific Internet Protocol
10 gateway.

10. In a computer network with a plurality of network devices, a method for
distributed generation of unique random numbers for digital cookies, comprising the
steps of:

15 maintaining a list of complete digital cookies in use on the computer network on a
second network device;
generating a x-bit bit mask template on a second network device, wherein the x-
bit bit mask has n-bits randomly set to a value of one and remaining (x-n) bits randomly
set to value of zero wherein n is less than or equal to x;

20

sending the x-bit bit mask template to a first network device on the computer network;

receiving a request from the first network device to request a second portion of a x-bit digital cookie from the second network device, wherein the first message includes
5 an first portion of the x-bit digital cookie;

(a) generating a second portion of a x-bit digital cookie on the second network device;

(b) generating a potential x-bit digital cookie on the second network device using the first portion of the x-bit digital cookie generated on the first network device and the
10 second portion of the x-bit digital cookie generated on the second network device;

(c) comparing the potential x-bit digital cookie with complete digital cookies from the list of complete digital cookies maintained on the second network device that are in use on the computer network;

repeating steps (a), (b) and (c) until a potential x-bit digital cookie is generated
15 that is not in use on the computer network; and

sending the second portion of the x-bit digital cookie for the potential x-bit digital cookie that is not in use on the computer network to the first network device, wherein the first network device uses the first portion of the x-bit digital cookie and the second portion of the x-bit digital cookie to create a complete x-bit digital cookie that is not in
20 use on the computer network.

11. A computer readable medium having stored therein instructions for causing a central processing unit to execute the method of Claim 10.

12. The method of Claim 10 wherein the first portion of the x-bit digital cookie 5 includes an n-bit random number, wherein the n-bits were determined by counting a number of bits set to the value of one in the x-bit bit mask sent to the first network device and generating an n-bit random number on the first network device.

13. The method of Claim 10 wherein step (a) includes generating a (x-n) bit 10 random number on the second network device, wherein the first portion of the x-bit digital cookie from the first network device includes n-bits.

14. The method of Claim 10 wherein step (b) includes placing values of bits from a n-bit first portion of the x-bit digital cookie generated on the first network device in bit 15 positions with a value of one in the x-bit bit mask, and placing values of bits from a (x-n) bit second portion of the x-bit digital cookie generating on the second network device in bit positions with a value of zero in the x-bit bit mask.

15. The method of Claim 10 wherein the x-bit bit mask template is a 64-bit, bit 20 mask template.

16. The method of Claim 10 wherein the second network device is any of a
Distributed Network Address Translation gateway or a Realm Specific Internet Protocol
gateway.

5 17. In a computer network with a plurality of network devices, a method for
distributed generation of unique random numbers for digital cookies, comprising the
steps of:

 sending a first request from a first network device to a second network device for
an x-bit bit mask template;

10 receiving a first response on the first network device from the second network
device including a x-bit bit mask template, wherein the x-bit bit mask template has n-bits
randomly set to a value of one and remaining (x-n) bits randomly set to a value of zero,
wherein n is less than or equal to x;

15 counting n-number of ones in the x-bit bit mask template on the first network
device;

 generating an n-bit random number on the first network device based on the n-
number of ones counted in the x-bit bit mask;

 sending a second request to the second network device including the n-bit random
number for a (x-n) bit random number

20 receiving a second response from the second network device including a (x-n) bit
random number; and

creating a complete digital cookie using the (x-n) bit random number, the x-bit random number and the x-bit bit mask, wherein the complete digital cookie is not in use on the computer network.

5

18. A computer readable medium having stored therein instructions for causing a central processing unit to execute the method of Claim 17.

10 19. The method of Claim 17 wherein the x-bit bit mask template is a 64-bit bit mask template.

15 20. The method of Claim 17 wherein the second network device is any of a Distributed Network Address Translation gateway or a Realm Specific Internet Protocol gateway.

21. The method of Claim 17 further comprising:
sending the complete x-bit digital cookie in a plurality of messages used to a establish a secure connection between the first network device on the computer network and third network device on a remote computer network.

20 22. The method of Claim 21 wherein the plurality of messages include a plurality of Internet Key Exchange protocol messages.

23. In a computer network with a plurality of network devices, a method for distributed generation of unique random numbers for digital cookies, comprising the steps of:

- 5 maintaining a list of complete digital cookies in use on the computer network on a second network device;
- 10 generating a x-bit bit mask template on a second network device, wherein the x-bit bit mask has n-bits randomly set to a value of one and remaining (x-n) bits randomly set to value of zero, wherein n is less than or equal to x;
- 15 sending the x-bit bit mask template to a first network device on the computer network;
- 20 receiving a request from the first network device to request an (x-n) bit random number for an x-bit digital cookie from the second network device, wherein the first message includes an n-bit random number;
 - (a) generating a (x-n) bit random number on the second network device;
 - (b) generating a potential x-bit digital cookie on the second network device using the n-bit random number generated on the first network device and the (x-n) bit random number generated on the second network device, wherein the potential x-bit digital cookie is generated by placing values of bits from the n-bit random number generated on the first network device in bit positions with a value of one in the x-bit bit mask, and placing values of bits from a (x-n) bit random number generating on the second network device in bit positions with a value of zero in the x-bit bit mask;

(c) comparing the potential x-bit digital cookie with complete digital cookies from the list of complete digital cookies maintained on the first network device that are in use on the computer network;

repeating steps (a), (b) and (c) until a potential x-bit digital cookie is generated
5 that is not in use on the computer network;
sending the (x-n) bit random number used to generate the potential x-bit digital
cookie that is not in use on the computer network to the first network device, wherein the
first network device uses the n-bit random number and the (x-n) bit random number to
create a complete x-bit digital cookie that is not in use on the computer network.

10

24. A computer readable medium having stored therein instructions for causing a
central processing unit to execute the method of Claim 23.

15

25. The method of Claim 23 wherein the x-bit bit mask template is a 64-bit, bit
mask template.

26. The method of Claim 23 wherein the second network device is any of a
Distributed Network Address Translation gateway or a Realm Specific Internet Protocol
gateway.

20

27. The method of Claim 23 further comprising generating a complete x-bit digital cookie on the first network device using the n-bit random number, the (x-n) bit random number and the x-bit bit mask template.
